Lanka Education and Research Network

Introduction to Security with respect to Campus Networks

06th September 2021

Network Security and Performance Workshop - UPROUSE with LEARN

Thilina Pathirana

Based on and Credits: APNIC, APRICOT, NSRC, SANOG Security Tracks

What is a REN

- REN => Research and Education Network
- High bandwidth, Low Latency, open networks with no Filtering
- Enable research or services that could not be accomplished otherwise
- Our goal is to build networking capacity to support Research and Education
 - Remember: University = Research & Education
- Buying all service from your local ISP is a losing game you will spend more money and not have control of the network
- The Campus Network is the foundation for all Research and Education activity
- Without a good campus network, the Research and Education Network can't work as well as it should

What is a Campus Network

- High bandwidth Networks can be 10G, 40G or may be 100G
- Can be multiple acres of ground, multiple multi-story buildings
- Low latency fiber networks
- High number of L3, L2 devices.
- Can be wired, wireless or both
- High number of services
 - Public
 - Confidential
 - Valuable, Copyrighted
- Large research data volumes
- High User Base technical / non-technical

Security in Campus Networks

- Securing and monitoring the security of a campus network is difficult
- Campus networks need to be fairly open
- Always will have viruses, attacks, and people generally acting bad

You get a call from some agency (eg. LEARN/ CERT) saying that they have a report that one of your hosts is participating in a Denial of Service (DoS) attack

- What do you do?
- How do you find the host (very hard if NAT)?

- Assets What are we protecting?
 - Many sorts of targets:
 - Network infrastructure
 - Network services
 - Application services(money!)
 - Data
 - User machines
- Attackers From whom?
- Attacks Common Attacks
- Defenses Defenses

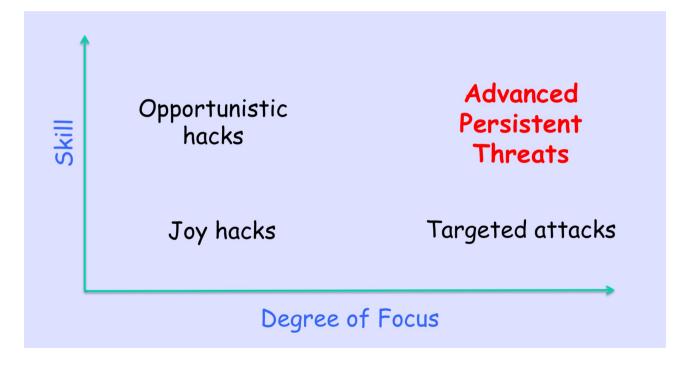

- Assets What are we protecting?
- Attackers From whom?
 - Script kiddies: little real ability, but can cause damage if you're careless
 - Money makers: hack into machines; turn them into spam engines; etc.
 - Government intelligence agencies, AKA Nation State Adversaries

- Attacks Common Attacks
- Defenses Defenses

- Assets What are we protecting?
- Attackers From whom?
- Attacks Common Attacks The Threat matrix

Defenses - Defenses

Joy Hacks:

- A Hacks done for fun, with little skill
- Some chance for damage, especially on unpatched machines
- △ Targets are random; no particular risk to your data (at least if it's backed up)
- Most hackers start this way
- △ Common in many Campus Networks

Something interesting:

Opportunistic Hacks:

- Often quite skilled, but don't care much whom they hit
- ⚠ The effects are random but can be serious
- Consequences: bank account theft, Social account theft, machines turned into bots, etc.

Have your users reported these kind of attacks???

An old example:

We are happy to inform you that you have been registered to participate in the workshop on "Workshop on Network Security" going to be at the Information Technology Center, University of Peradeniya from 12th to 14th June 2018.

The Workshop will start at 08.30 am.

Detailed program agenda can be found at https://ws.learn.ac.lk/wiki/netsec2018. We would also like to remind you to bring a laptop (20GB free disk space and at least 4GB RAM).

We are happy to inform you that you have been registered to participate in the workshop on "*Workshop on Network Security*" going to be at the *Information

Technology Center, University of Peradeniya* from 12th to 14th June 2018.

The Workshop will start at 08.30 am.

Detailed program agenda can be found at https://ws.learn.ac.lk/wiki/netsec2018 https://ws.learn.ac.lk/wiki/ipv62017. We would also like to remind you to bring a laptop (20GB free disk space and at least 4GB RAM).

Targeted Attacks:

- ⚠ Attackers want you. Sometimes, you have something they want;
- ▲ Background research—learn a lot about the target
- May do physical reconnaissance
- Watch for things like "spear-phishing" or other carefully-targeted attacks

Have your users reported these kind of attacks???

Advanced Persistent Threats (APT):

- Very skillful attackers who are aiming at particular targets
- Sometimes though not always working for a nation-state
- △ Very, very hard to defend against them
- May use non-cyber means, including burglary, bribery, and blackmail
- ⚠ Note: many lesser attacks blamed on APTs

Have your users reported these kind of attacks???

- Assets What are we protecting?
- Attackers From whom?
- Attacks Common Attacks
- Defenses Defenses
 - —Defense strategies depend on the class of attacker, and what you're trying to protect
 - —Tactics that keep out script kiddies won't keep out an intelligence agency
 - But stronger defenses are often much more expensive, and cause great inconvenience

- Joy Hackers:
 - By definition, joy hackers use existing tools that target known holes
 - Patches exist for most of these holes
 - These hacking tools are known to AV companies
 - The best defense is staying up to date with patches
 - Also, keep antivirus software up to date
 - Ordinary enterprise-grade firewalls will also repel them

- Opportunistic Hackers:
 - Sophisticated techniques used
 - Possibly even some 0-days
 - You may need multiple layers of defense
 - Up-to-date patches and anti-virus
 - Multiple firewalls
 - Intrusion detection
 - Lots of attention to logfiles
 - Goal: contain the attack

Targeted Attacks:

- Targeted attacks exploit knowledge; try to block or detect the reconnaissance
- Security procedures matters a lot
- How do you respond to phone callers?
- What do people do with unexpected attachments?
- USBs in the parking lot
- Hardest case: disgruntled employee or ex-employee

Advanced Persistent Threats:

- Very, very hard problem!
- Use all of the previous defenses
- There are no sure answers even air gaps aren't sufficient (Google Stuxnet)
- Pay special attention to procedures
- Investigate all oddities

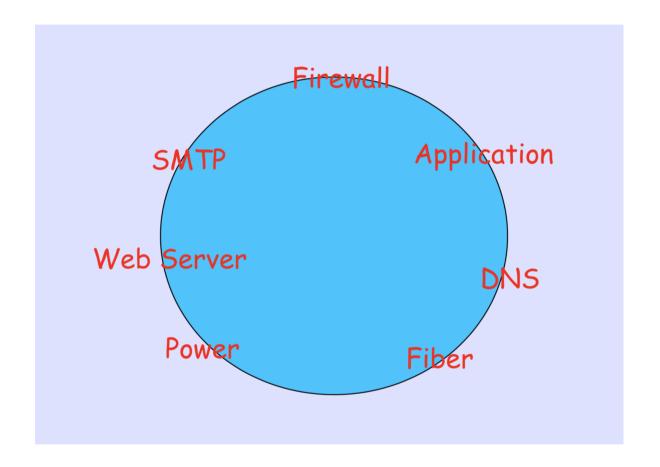

- Don't use the same defenses for everything
- Layer them; protect valuable systems more carefully
- Maybe you can't afford to encrypt everything—but you probably can encrypt all communications among and to/from your high-value machines
- The defender has to think about the entire perimeter, all the weakness
- Because the attacker has to find only one weakness and it is not a good news for defenders

Attack Surface

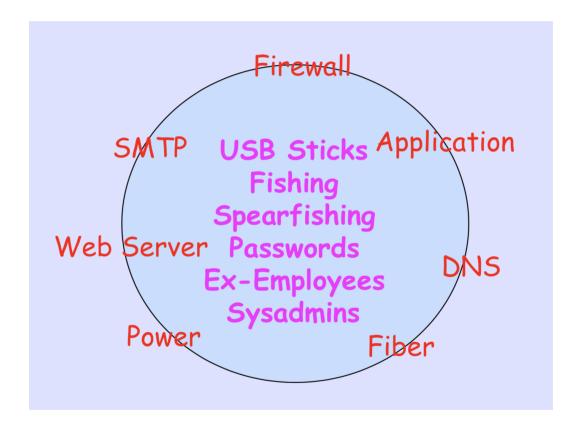

You have to cover all

Attack Surface

Not only the perimeter but also;

Security in a process

You can never achieve security – it is a process that you have to continually work on

- Assessment what is at risk
- Protection efforts to mitigate risk
- Detection detect intrusions or problem
- Response respond to intrusion or problem
- Do it all over again

Lanka Education and Research Network

Thank You
